INFRASTRUCTURE RELIABILITY AND PLATFORM ENGINEERING

Infrastructure engineer and technical leader with 20+ years of experience across hyperscale cloud storage, distributed systems, and hardware-to-software platforms. At Oracle Cloud Infrastructure, drive cross-team work in reliability automation, capacity efficiency, disaster recovery, and region buildout. Combine hands-on systems development and root-cause analysis with technical direction, engineering mentorship, and delivery of ambiguous programs from prototype to release.

Professional Experience

Oracle Corporation | Jun 2016 - Present

Oracle Cloud Infrastructure | Storage Reliability and Platform Engineering

- Drive automated qualification and deployment through CI/CD and single-click region buildout, turning repeated infrastructure delivery tasks into automated workflows.
- Automate failed-disk handling and detection and handling of single-host failures. Refactor the backend to contain failures within a feature, volume, or device and limit their operational impact.
- Lead capacity-efficiency initiatives: cold-data compression reclaimed 20-30% of storage space, increasing sellable capacity. Optimize idle-volume backend capacity through work associated with U.S. Patent 11,412,043.
- Design and drive cross-team initiatives for a unified platform serving object, block, and file workloads, including shared replication and erasure coding for object storage.
- Lead cross-region replication and asynchronous volume-group replication from design through delivery, strengthening disaster-recovery capabilities. Ownership includes replication, leader election, snapshots, and backup.
- Scale the backup backend with service growth and implement application-controlled snapshotting. Build block-storage support on the unified stack and drive migration from the existing backend.
- Scale iSCSI serving through multiprocessing and rearchitect networking to reduce hops and increase the number of attached volumes, addressing backend and access-path constraints.
- Implement trimmed-block reclamation to recover unreferenced storage capacity and contribute to deep archival capabilities for long-term retention.
- Design and develop a near-real-time marketplace metering service from prototype to public release; help redirect and implement a data-processing service through internal release.

Professional Experience Continued

Microsoft Corporation | Sep 2005 - May 2016

Windows Reliability | Azure Storage | Developer Tools | Device Platforms

- Served as a Windows operating-system, filesystem, and disk subject-matter expert. Led kernel-dump analysis and root-cause investigations, working with customers and development teams to resolve disk and cluster failures.
- Led Visual Studio Cluster, Parallel, and GPU debugger test teams across HPC/MPI, concurrency, CUDA, OpenGL, and DirectX. Built local and remote teams, contributed to hiring, and mentored engineers.
- Implemented reusable engine test libraries for cluster and GPU debuggers and architected a debugger UI test library. Coordinated with vendors to migrate validation across product cycles.
- Designed and implemented an RDMA library for a proof-of-concept Azure Storage backend, applying systems programming expertise to storage transport.
- Owned HoloLens depth-camera functionality end to end from prototype through public announcement. Developed hardware-validation drivers and tools for Surface Hub and Kinect.

Intel Technology India Private Limited | Mar 2002 - Sep 2005

Systems Software and Hardware Validation

- Designed and developed CPU-core and cache/memory-subsystem validation tools, including Linux kernel programming and drivers for test cards and chipsets.
- Investigated hardware and operating-system defects, drove issues to closure, and wrote targeted patches. Developed network-card management and configuration software for Windows and Linux.

Earlier Experience

Infineon Technologies (formerly Siemens Semiconductor) | Mar 2000 - Mar 2002. Developed systems software to configure, monitor, and control telephone-exchange cards.

Technical Skills

Languages: C/C++; Java, Python, and C# as needed.

Reliability and systems: Fault containment; disk and host failure automation; disaster recovery; replication; snapshots and backup; capacity efficiency; Linux kernel and device drivers; RDMA; concurrent and parallel programming.

Infrastructure and tooling: Kubernetes, Terraform, Docker, Helm, Prometheus, CI/CD, gRPC, Folly, Boost, ZooKeeper, Kafka, and Flink.

Education

B.E., Computer Science and Engineering, Mangalore University
