Career Objective

Be a Technical leader and drive project team(s) to achieve organization goals. Manage time and work effectively and efficiently. Constantly learn and improve technology and product.

Summary

I have a broad set of experience from hardware validation, user mode applications, kernel mode drivers and distributed system service. I have been leading multiple initiatives across team or features. I have experience being in the V1 of the product, working through uncertainty and realizing the product. Currently design, drive and implement new features/initiatives.

Software

Prefer C/C++. Work on Java, Python and C# as needed.

Open-source stacks – Concurrent/Parallel programming, gRPC, Folly, Boost, Terraform, Kubernetes, Dockers, Helm Charts, Prometheus, Apache Flink, Zookeeper, iSCSI, Apache Kafka

Professional Experience

Oracle Corporation

Duration: June-2016 – till date

Unified Storage Service

- Building core storage service which runs Object, Block and File
 - Building replication layer to serve various storage services
- Designing and driving multiple initiatives across teams on the new stack
 - EC for object storage
 - Bring up Block storage on the new unified storage stack
 - Migrating Block storage from old stack
 - Building Deep Archival

Block Storage

- Features
 - Cross region replication for disaster recovery
 - Cross region volume group async replication
 - Application controlled snapshotting
- Scaling
 - Scaling backup backend with growth of our service
 - Scale our iSCSI server by multi-processing.
 - Rearchitected networking subsystem to reduce hops – increase the number of attached volumes

- Efficiency projects
 - Increase sellable capacity by compressing cold data – Reclaimed at least 20-30% of the space.
 - Optimize backend capacity for idle volumes(Patent 11412043)
 - Reclaim trimmed user blocks. This accounts for 6-7 % of unreferenced data
- Software Resiliency
 - Refactoring backend to restrict failures to specific feature or volume or device
 - Automate failed disk/host handling

Marketplace

- Design and develop software metering service for the marketplace, from prototype to a public facing almost real time service.

Data Pipeline Service

- Pivoted the team objective and implemented data processing service. I was involved in the prototype of this service and took this all the way to Internal release.

Microsoft Corporation

Duration: Sept-2005 – May-2016

Azure Storage

- Design and implemented library to support the new (POC) Azure Storage backend infrastructure using RDMA.

Surface Hub/Kinect Tools

- Design and develop drivers and tools to help the hardware design verification team.

HoloLens

- Responsible for the end-2-end working of depth cameras on HoloLens from prototype to its release

Xbox One

- POC of Xbox 360 graphics emulation (Back Compatibility) on Xbox One.

Visual Studio

- Lead multiple debugger projects – Cluster Debugger(HPC – MPI), Parallel debugger(Concurrency) and GPU debugger(CUDA, OpenGL, DirectX). Build a team of 5 people and 10 people remote.

GTSC

- Supported Windows Platform team, SME in Windows OS, File System and Disk issues. My primary responsibilities include kernel dump analysis, provide root cause analysis, reverse engineer, code review, work with dev team to get the bug fixed, interacting with the customer to help them resolve the issue, resolve disk and cluster issues.

Intel Technology India Private Limited

Duration: March 2002 – Sept 2005

- Design and developed tools to validate CPU Core and Caching/Memory Subsystem. This also involves Linux kernel programming and developing drivers for test cards and chipset.
- Debug and root cause hardware/OS bugs, drive bug to closure and sometime write patches to rectify the bug.
- Design, development and test network card management/configuration/manageability software on Windows and Linux platform.
